PREGNANCY AND COVID-19

Are pregnant women at higher risk for COVID-19?

• We do not currently know if pregnant people have a greater chance of getting COVID-19, or if they are more likely to have serious illness as a result of infection.
• Based on available information, pregnant people seem to have the same risk as adults who are not pregnant.

What about my baby?

• Mother-to-child transmission of coronavirus during pregnancy is unlikely.
• After birth, a newborn is susceptible to person-to-person spread of COVID-19.

Best Practices for Pregnancy during COVID-19

• Keep healthy, well balanced meals in stock.
• Consider food delivery services when necessary.
• Enact self-isolation and social distancing as much as possible.
• Stock up on essential medications and vitamins.
• Consider delivery from your pharmacy if possible.
• Stay active and try to incorporate virtual physical activity (via YouTube, apps, video chats) with family and friends.

Breastfeeding Care During COVID-19

• In limited studies, COVID-19 has not been detected in breast milk; however, we do not know for sure whether mothers with COVID-19 can spread the virus via breast milk.
• If you have symptoms of COVID-19, follow CDC guidelines (listed on the following page) and also adhere to these measures:
  • Wear a face mask during feeding.
  • Wash hands before touching breast pumps and bottles.
  • Allow someone who is well to bottle-feed breastmilk in mom’s place.
Coping with Stress and Anxiety

• Take care of your body and baby, and get enough rest.
• Try a daily meditation or just take some isolated quiet time to yourself to unwind.
• Unplug from social media and the news cycle.
• Keep in touch virtually with friends and family.

Contact your Health Care Provider for guidance regarding appointments and any other concerns during this time.
